## Program Risk Mitigation

eKuber approaches and methodologies inherently address the program risk factors within each approach and methodology, by adopting counter measures through various control mechanisms.

**eKuber professionals understand, minimize and control most important risks through their unique approaches**

## Program Cost, Schedule and Performance

Inherent in any program, we have the capability to model the availability of funds, prioritization of tasks/program features and the schedule in such a way that would provide a government agency the capability to assess different scenarios and adopt align cost, schedule and requirements to agency preference. This capability is based on the Balance Scorecard methodology and allows for simulation of different factors to predict different outcomes and is applicable to government programs, evaluation of commercial initiatives, the performance of different functional lines of business (LOBs) and for Value Based Management. Additionally, we have a methodology to setup and execute a program management infrastructure that monitors all aspects of program management like team dynamics, cost, schedule, performance, issues, risks, collaboration, audit, program artifacts, events, communication etc.

## Cultural Change

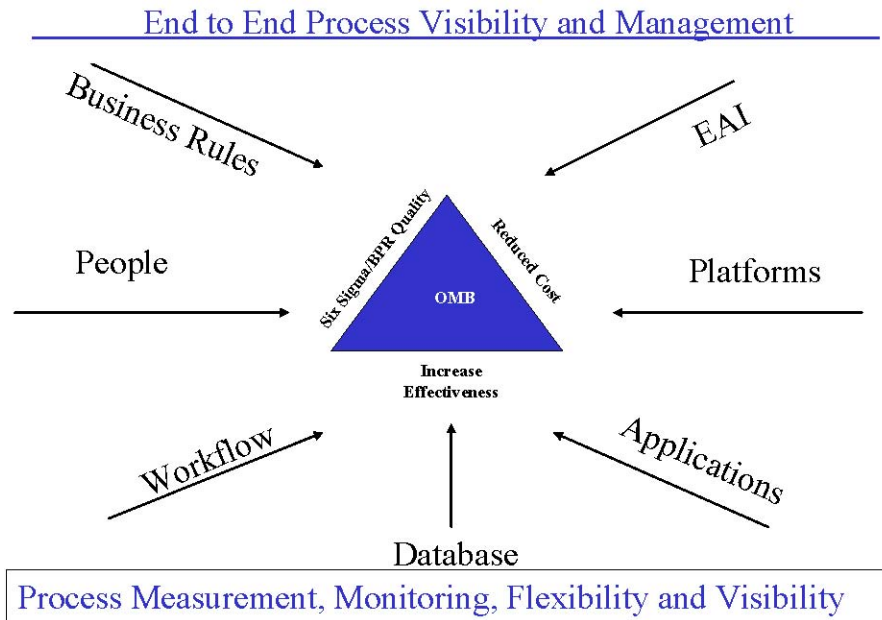

It is an inherent risk, present in all large programs that have the scope to change the organizational framework of an agency. eKuber has a methodology, a culmination of the learning experience from several years of experience working with the government and fortune 500 projects, that allows for a change management methodology to be imbedded in the over all program execution methodology. The change management is driven by BPR and contains the tenets addressing the modified organizational structure, roles & responsibilities, processes, communication strategy and training plan to address all stakeholders for a smooth transition.

## Focused Prototype Site/Processes

Identification of an improvement site and a process, representative of the overall program is an essential feature of the comprehensive plan and our methodology helps in the identification and successful achievement of that first win to not only support the momentum and but also test our assumptions.

## Integration with Existing Technologies

eKuber has a methodology to undertake a portfolio analysis of the existing IT assets and prioritize their IT effectiveness to agency's business. Based on the prioritization, eKuber recommends a way forward for integration of the needed technologies along with a CIO dashboard mechanism for ongoing evaluation of the effectiveness of the integrated model to the overall business. The approach balances the cost of each item in the technology portfolio with value to the agency.

## Defining Conceptual Strategic Framework and Program Execution Plan

The Conceptual Strategic Framework and Program Execution Plan needs to be defined based on the vision of the agency. We have questionnaires and templates that help with defining the strategic framework that delivers the value and forms the basis for a program project plan that takes into account the sequence of activities that help in delivering the value.

## Timely availability of Resources and Information

Timely availability of the resources and the information details from both the vendor and agency are critical in ensuring the successful progress and delivery of the solution. eKuber has the mechanism to ensure a smooth collection of all the information and collaboration between different skill-sets to ensure a robust analysis.
